"Resno® concealed waterless Urinal“

www.resno.ca

A WATERLESS Plumbing Fixture, classified as a "CONCEALED URINAL", specifically intended for residential use, designed to be installed permanently into a 2”x 4” wall, for the purpose of disposing of male urine into a sewer system in a convenient and sanitary manner. The unit includes a tip-out door, stopping at a specific angle, to provide a trough for the purpose of directing the urine into the drainage system. The one-piece trough-door easily lifts out for periodic sanitizing.

A yearly savings of water and sewer charges; but most important, the conservation of Millions of gallons of precious drinking water.

Men’s urine secretes a “salts” which settles in the bottom of the trap, like a fine sand which can collect sufficiently to prevent the urine flow into the drain tube. This is resolved with monthly maintenance. Simply lift out the trap insert, remove the drain tube, and with a small bucket of warm soapy water and a brush, simply wash it all down the drain. Replace the drain tube, add a cup of water to prime the trap. Add 2 oz. of “Blue Seal” (available at most plumbing outlets). Blue Seal is a liquid odor barrier that floats on top of the urine, preventing odors from escaping up into the room. Some owners, have found as an alternative, that a few shots of Febreeze Air Freshener is sufficient. Complete instructions are in the “Owners Manual”.

The residential design is intended to provide a convenient and aesthetically acceptable fixture suitable for installation in rooms frequented also by females. Such rooms may include bedrooms, laundry rooms, mud-rooms, pool buildings.

If a community of 130,000 homes had “Resno Waterless Urinals”, it would save over a MILLION GALLONS of water a DAY. (Excerpt from the report by Derek Satnic, P.Eng, LEED AP, with 1.3 males per unit, using flush toilets.)

Certified for Plumbing Codes in USA & Canada.
